

introducing the rest of the day, the Rainbowfish! How would you like to introduce yourself to the camera?

Ms. Rainbow: If everyone my name is, as she mentioned Ms. Rainbow, and I get a rainbow trout, I'm also known as rainbow. Fun fact, the scientific name for a rainbow trout is an *oncorhynchus mykiss*. We can be as long as 48 in. and weighing 100 lb.

Reporter: What is it like being the most common trout to get caught by a human?

Ms. Rainbow: It is kind of frustrating but it's fine except that most of my family that died was caught by a human. But my friends told me that some areas in Alaska don't allow fishing to save all.

Reporter: That that's good to hear. Watch out for the hatch!

Ms. Rainbow: When, I almost got eaten! Thank you.

Reporter: What are some things that need improving?

Ms. Rainbow: I think everything is pretty good except that our habitats are getting smaller or even losing our habitats because of humans making roads and other stuff.

Reporter: What do you think humans can do to make those things not happen?

Ms. Rainbow: Well, I think they could stop cutting trees near water and they could make less roads near the ocean, river and streams. (Ms. Rainbow's stomach growls)

Reporter: Would you like a snack? We have fish, insects, snails, moss, sea shells, fish eggs, freshwater larvae...

Ms. Rainbow: (interrupting) I'd take fish, freshwater larvae, and insects.
