

fresh water and they come
back to the sea to lay
eggs. The young stay
at sea up to three years. Then
they migrate to the fresh
water where they live most
of their adult life until they
go back and lay eggs. The
European Eels eat a lot
of different foods. They eat other
fish, crabs, lobsters, insects, worms
and birds. Since the 1950s their
numbers have gone down a lot
and they are now endangered.
I've learned so much about
European Eels. I have never
thought about it.
