

lots of other risks!

I would rather be a kokanee salmon. The kokanee salmon don't migrate, why? Because they are landlocked. Landlocked means that the fish are stuck in a pond or lake. OK, maybe I wouldn't be a kokanee salmon.

All salmon must take chances. When they are young, the salmon must decide if they want to dash into the open to grab a larva and risk being eaten by a bigger fish. Adult salmon must decide if they want to try to jump up a waterfall, and risk being smothered or by a bear.

Wolves seem like they would go for moose or deer, but they do eat salmon. The wolf will grab a salmon and then just eat the head. They just eat the head, maybe because they are afraid of getting worms. Smart wolves, but it also seems like a waste.

Eagles can spot the sockeye salmon from far away because the salmon's colors are bright and the eagle's good eyesight.

I think that the sockeye salmon are really courageous. (And maybe I'll just stick to being a farmer).
