

When it gets darker her feet can feel very hot. The female is very busy
she just finished building her nest. It can be found very high on a big
branch on a tree. She built her nest today so built. She had to make
it better in Spanish Moss and just a white feathers and wood. Her mate
is sitting nearby on a branch guarding her from predators. His way of
defending her is singing. He also spends his time foraging for food for
them to keep them both energetic and happy.

The warbler sits on her eggs for 11-15 days and cannot wait for them
to hatch. Once they hatch they will both have to spend time caring
for them, as they're enjoying the time that they have now before their
new babies come into the world.
