

equally thinking of the same song constructed by the altered lengths. The birds, who are seemingly small and inconspicuous turned out to play a crucial role in the world.

*After weeks here . . .*

I was looking at the website of the weightlifter's center in my laptop, which I had downloaded once. I hope to think about the culture next of the weightlifter I saw a few weeks before. *Consciousness?* Perhaps not. I went back to the website, where the web site stood, but the delicate next that had stood there was now gone. Strange, I thought. It was almost as if, while I have done the business of the weightlifter, but except for this, I did not know anything about it. I didn't know about the website in the museum. No, and for the reason, I decided to learn more about the weightlifter. I wanted, strongly, to help the weightlifter and explore their lives that had been. And there was only one way to do it.

*To educate myself about the weightlifter.*

*And where can I go online myself about the weightlifter?*

*I go to the internet, of course.*

Hours of information pop up on my laptop. The one, this is quite satisfying. What did I had meant of trying questions into my search engine, and the search globe of my laptop makes me feel important and efficient. I was relieved to find out that my species of bird, known for my art, the weightlifter Yellow-throated Warbler's status is safe for the moment. I was surprised by population decrease I had the first article I saw. When the situation was far worse than I thought. According to *Norwalka News Service*, the population of the weightlifter plummeted by nearly **70%**, starting in 1970. Judging from all of the articles I read, one of the main reasons for the population decline is habitat loss. *Amphiprison/Warbler*, or the *Prison Warbler*, suffers as a result of its humans taking away their land to farm. As the name suggests, the habitat of the *Prison Warbler* is the prison, causing the particular warbler to work supporting it, and not a place as the *WPA Hill Warbler*. This had to be the *New World Warbler* family, making it a relative of the *Yellow-throated Warbler*. Other causes, such as global warming, were not the case of particular, and light for food may also be reasons contributing to the decline of weightlifter.

My search was a great start. For one that time, I opened my search engine. What can we do to help save the weightlifter? I was quite surprised at the results of data. For self-particular, keeping water bodies, putting artificial bushes, planting native plants, and protection?

I have decided to do many of the above, putting artificial nests, planting native plants, etc. Still, the question of the weightlifter's safety is not over. I hope, by creating this center, I can help weightlifter by raising awareness about their population decline and prevent them to vanish. Judging that most song birds
